# Response to ARERA's Network Development Plan 2021-2031

**CURRENT**

Enabling Network Technology  
throughout Europe

currENT is the industry association representing innovative grid technology companies that operate in Europe and empower the grid. currENT aims to generate greater awareness of new Grid Enhancing Technologies (GETs) and accelerate their implementation. We do so by working with the broader stakeholder ecosystem on future-proof regulatory and policy frameworks in Europe.

We believe that renewable generation and energy efficiency are the ‘first order’ solution for taking the European Green Deal ambition and the Climate Law from promise to practice. Renewable-based electricity solutions can meet more than 70% of our total energy needs by 2050. Making the ‘can do’ a ‘will do’ we need powerful climate-proof ‘clean’ power grids. Such grids are already possible today.

- Power networks – both transmission and distribution – have to become even stronger enablers and accelerators of the energy transition, paving the way for further electrification, rising demand and sector coupling.
- Enabling network technologies will assist and promote the integration of higher levels of renewables.
- Designing tomorrow’s grid using today’s technology and an incremental approach is no longer possible if the COP21 and European Green Deal ambition is to be implemented.

Therefore, energy system operators must be encouraged and incentivised to update their toolbox for existing and future grids.

On the qualification and the use of new technologies in NDPs, currENT recommends to:

- Require system operators to consider all possible solutions for an identified network need.
- Use the NOVA principle in regulation to make sure already available new solutions are used for existing grids as the first step in network development. The NOVA approach should be related to ENTSO-E’s Technopedia and other available grid enhancing technology overviews.
- Develop ‘best practices’ across Europe for qualifying new technologies:
  - o Increase transparent sharing of learnings among system operators, countries and broader industry.
  - o Avoid duplication of pilot projects which slows down the uptake of new solutions and ultimately delays benefits to customers.
- Align the priorities for innovation to ensure the highest potential innovations are funded, developed, trialled and ultimately rolled out.

We specifically refer to the following publications both on available technologies and recommendations for updating the regulatory approach to accommodate new solutions.

Reports on the technological advancement are showcased on a large scale through:

- WATT’s Brattle Report of the U.S. market<sup>1</sup>;

---

<sup>1</sup> WATT, Brattle. 2021. Unlocking the Queue with Grid-Enhancing Technologies: Case study of the southwest power pool. [https://watt-transmission.org/wp-content/uploads/2021/02/Brattle\\_\\_Unlocking-the-Queue-with-Grid-Enhancing-Technologies\\_\\_Final-Report\\_Public-Version.pdf](https://watt-transmission.org/wp-content/uploads/2021/02/Brattle__Unlocking-the-Queue-with-Grid-Enhancing-Technologies__Final-Report_Public-Version.pdf)90.pdf

- ENTSO-E's Technopedia underlining the readiness levels of today's available technologies<sup>2</sup>;
- The German Ministry for Economy and Energy's study on the central role of grid optimisation and higher utilisation of the existing networks<sup>3</sup>;
- THEMA Consulting's report on higher available capacity and increased market integration in Northern Europe<sup>4</sup>;
- IAEW's scientific exemplary study on modular power flow control enhancing the German transmission grid capacity as commissioned by Smart Wires.

The existing research is backed by Consentec's soon-to-follow study on smart transmission technologies commissioned by currENT<sup>5</sup>.

Recommendations for updating the regulatory approach have been stated by:

- The Ecorys Report at the European Energy Infrastructure Forum 2019<sup>6</sup>;
- CSEI's and FSR's paper on the economic issues and regulatory options to promote energy network innovation for a green transition<sup>7</sup>.

currENT thanks ARERA and Terna for the opportunity to contribute to this NDP. We are aware that the NDP is not based on the updated NECP, and that this will prove to be challenging as the NDP is not likely to reach the 55% emission reduction target and the Climate Law provisions. This is another reason for ARERA and Terna to be ambitious when using new, available tools to get most of the essential power networks in Italy. currENT is happy to deepen our exchange through a joint workshop and organise a public webinar by the end of 2021 focusing on the Italian NDP.

currENT proposes five points for ARERA's and Terna's consideration:

## 1. GRID ENHANCING TECHNOLOGIES ARE READY FOR WIDE-SCALE USE IN ITALY

Italy wants to become an energy transit hub in the Mediterranean space. The increase of the transfer capacity North South is a requirement for taking on this role, but more grid capacity is also crucial for reaching the European Green Deal targets and improving the power network's general resilience. In particular, in the overregulation scenario of the NDP 2021, a lot more optimisation and grid enhancement will be needed to significantly increase the levels of transferred capacity from the South to the North of Italy. Optimisation technologies such as those represented by currENT membership - FACTS devices, modular SSSC, Dynamic line rating, and future superconductors - can largely contribute here. Those technologies are widely described in ENTSO-E's Technopedia<sup>8</sup>, as well as on currENT's website<sup>9</sup>.

## 2. NOVA PRINCIPLE TO BE INTRODUCED IN ITALIAN GRID PLANNING

There is no evidence in the NDP that Italy uses innovative technologies to optimise and enhance the power network. Countries like Germany, Austria and Switzerland are committed to the so-called NOVA principle<sup>10</sup>, saying that optimisation of the existing grid should happen before reinforcement and grid expansion. currENT advocates that we will need to efficiently combine optimisation, reinforcement and expansion to address the electrification and renewables uptake where networks move centre stage. The potential of GETs has been assessed by studies that are listed at the beginning of our contribution.

## 3. INNOVATIVE NEW GRID SOLUTIONS MUST BE ADDED TO THE NETWORK PLANNING TOOLBOX

Given the 40 years plus lifetime of new grid assets, the latest innovative and technological advancements must be taken into account when planning new grids. currENT recommends that ARERA and Terna review the processes for qualification of new technologies that have been proven in other geographies to ensure that technologies that can deliver significant value to Italy in the long-term are sufficiently included and reasonably considered as possible solutions as part of the network development plan process. This would need to be supported by a substantial sharing of learnings and 'best practices' between ARERA, Terna and other network companies and stakeholders to minimise the risk of wasting research money and duplicating work on proving a technology that has already been proven on other networks.

There is a need to include GETs in the current and future NDPs, particularly those GETs that have higher TRLs and thus proven benefits. This is in line with recent European legislation which seeks to accelerate the transition to smarter low carbon grids, such as the Smart Grid Indicator, which NRAs were tasked to develop

<sup>10</sup> see the principle explained for example here on the website of TransnetBW [NOVA principle | TransnetBW GmbH](#)

by the end of 2020 and the relevant provision in the Energy Efficiency Directive relating to the efficiency of networks.<sup>11</sup> This is valuable for the Italian transmission network and national targets and on cross borderlines where GETs can support Italy's linear progress towards the EU 70% market available capacity target (so-called MinRam).

currENT understands that the so-called security programme established after the Italian blackout in 2003 allows TSOs to develop urgent measures. This programme is not subject to regulatory scrutiny. We suggest that it is changed towards a NOVA approach, forming part then of the NDP. This should include the toolbox that Terna uses, which needs to be augmented with the above-mentioned GETs. These solutions need to be consulted with the regulator and the stakeholders as part of the NDP process.

## 4. RAPIDLY DEPLOYABLE SOLUTIONS ENABLE DELIVERY OF PROJECTS AND RENEWABLES INTEGRATION

Given the common delays associated with implementing new infrastructure projects due to permitting and public acceptance complexities, the value of rapidly deployable solutions must be recognised, e.g. Dynamic Line Rating and modular power flow control solutions such as SSSC devices<sup>12</sup>. Rapidly deployable solutions can often be delivered in less than a year, leading to the quicker release of capacity and increased efficiency of the existing network. currENT recommends that ARERA and Terna consider whether any of the existing projects identified in the NDP could be improved through using rapidly deployable solutions as an interim or enabling measure, or in some cases, as a solution that can defer the need for other reinforcement. ARERA and Terna should also review existing selection and evaluation processes for projects to ensure that the methods fairly value the benefits of rapidly deployable solutions.

## 5. COMPLEMENTARY SOLUTIONS OPTIMISE USE OF THE EXISTING GRID

currENT would like to highlight the complementarity of GETs, particularly in maintaining network resilience, managing congestion and optimising the power flows across the network. By leveraging multiple GETs with different functionalities to meet a network need, in most cases, the overall impact will be far more significant than if only one technology was used in isolation. currENT recommends that ARERA and Terna consider GETs not only as standalone solutions but also as solutions that can be combined to maximise the benefits of an existing or new project, and ultimately provide maximum value to both the network and consumers.
